Welcome to the new world of accurate diagnosis and treatment of prostate cancer with Prostate MRI.

It has taken 34 years, many scientists and clinicians worldwide to develop prostate MRI for clinical use.

The current practice of PSA Screening, Trans Rectal Ultrasound (TRUS) **schematic** biopsy is **inaccurate** and misses many of the **aggressive** prostate cancers that cause serious **illness**.

Schematic biopsies frequently diagnose the numerous **not-aggressive** cancers that are slow growing and **cause no harm**. Men with not-aggressive cancers have undergone what we now know is unnecessary treatment.

With MRI there is a decrease in overdiagnosis and unnecessary treatment of the not-aggressive cancers. The Aggressive cancers are diagnosed earlier with greater opportunity for cure.

TRUS/MRI fusion targeted biopsy usually diagnoses the aggressive cancers at the initial biopsy session avoiding repeat biopsy sessions and biopsy complications.

When prostate cancers are diagnosed, Prostate MRI becomes key in treatment selection, planning and monitoring.

MRI Image based prostate cancer diagnosis, treatment and monitoring

Can you imagine being treated for a high fever, racking cough and pneumonia without a chest x-ray ?

Can you imagine being diagnosed or treated for prostate cancer without your doctor being able to see it ?

That is what we were doing!

Finally, the prostate can be seen in anatomic and functional detail with **prostate MRI**
